Plan

Area of focus

I enjoy writing code to solve problems, create video game and interactive art works. As such I plan to have my portfolio display different programs and works created from various languages and tool.

Design, Themes, Inspiration

The overall color scheme of the portfolio will be darker colors, drawing inspiration form site git hub, or various program editors. Where it's a darker color scheme meant to highlight and draw attention to the code, images and other aspects either be a lighter color then rest of the site or have background that is.

The sites design will be made up of a main site page that highlights who I am, my skills and then scrolling will lead to summaries of past and current projects. That when clicked will send you to a dedicated page which goes more in depth on the project and either show pictures of it or allows using it.

Social Media Integration

For social integration I will probably be provided links to my LinkedIn and GitHub. At the present I currently don't have an Instagram or other social media accounts which are public. Though I may create one to post updates on my current projects. If I do make this account I'll just add a link onto my portfolio as well

Best practices

Hello!

I'm **Joeb Rogers**, a passionate professional gameplay and tools engineer who loves to design and develop game-focused applications.

Got an interesting project? Send me a message at info@joebrogers.com

https://joebrogers.com/

What works

- It's clean, organized and layout in such a way that it's easy to follow content wise
- You know what skills they have, and then are given examples of work to back up skills
- Content is summarized and then can be clicked on to get more in-depth info about contributions/work
- Thing he wants to draw attention to in the text are bolded or designed in such a way to draw attention to it

What Doesn't

- The format kind of doesn't work, sense it really on the user scrolling to view the portfolio. A way to fix it could be to have tabs up top that allow jumping to different sections, well keeping the scrolling navigation.

https://www.tapskill.com/#games

What works

- It's easy to navigate, you can use the tool bar at the top to navigate to the different sections, or you can scroll through it.
- Things are displayed as sort of snippets or highlights/previews which then can be focus in on by clicking if the viewer wanted
- Included testimonies from clients

What Doesn't

- The way he organized his display of the work he's done is sort of clutter feeling
    - Overall organization of some pages other then his work showcase make it feel clutter/hard to navigate like his about me page. Which is a wall of text
- Lots of things repeat which can be a plus/minus, primarily the method to which one can contact him

What Works

- It's well organized, into sections that allow for the viewer to get a know them, what their skilled in and then the works they've done that back up their claims.
- Though if they wanted could also just jump to a particular project/section using the to bar rather than scrolling
- Project on the main page are summaries/snippets which then when clicked allow for further information to be read up on and learned about them
- About page, tells a good story/ of what they've done and are currently doing
- It's easy to navigate
- Highlights what his contributions were for the projects

What Doesn't

- The overall color scheme of the site makes some of the text kind of hard to read. Do to it being rather small and on a very white background

---

Best practices – things to do

1. Have it organized din to clear sections that allow for the overall skite to be easy to follow.
    - Easy to navigate
        - Don't try to fit everything into a page or section, spread it out
    - Make things you want to draw attention, draw it by either bolding it, or making it stand out in some way
2. Clearly highlight your skills, and then have work/projects that back up your claims. some of the skills to include:
        1. Coding languages,
        2. Game engines,

Portfolio Pitch
Keagan Rieder

        3. Tools: version control (GitHub), text editor, developer/code writing tools (visual studio code)

3. Show case your best work
    - Clearly highlight your role in it, skills and tools used
    - Images of source code, and or ability to run project
    - Overview of project, and then another page dedicated to it
